(54) Title: REFLECTOR

(57) Abstract: There is provided a reflector capable of reflecting light at a wide angle of incidence, for which the manufacturing time can be easily shortened even if a comparatively hard reflection sheet is used and of which the reflection sheet is effectively prevented from being cracked or peeled from the supporting body. A reflector comprising: a supporting body (1) which has a base (11) and a plurality of projections (12) having a sloping surface (120), and a reflection sheet (2) disposed on the surface of the base and sloping sections (120) of the projections (12); wherein the length of the surface (10) between the projections in the direction of width is larger than the length of the projection in the direction of width, and the surface of the base (1) has at least one peripheral surface (101b) of each projection (12) extending along the periphery of the direction of width of the projections (12) at each of the projections (12); and the reflection sheet (2) further includes a peripheral section (22b) disposed on the peripheral surface (101b) of each projection, and the sloping section (21) of the reflection sheet (2) is linked with one (20a) of the two adjacent sections (20a, 20b) between the projections (12) and separated from the other section (20b) and the peripheral section (22b) of the projection.
